

Willow Constitution (Security, Memory, Data Governance)

This constitution defines the non-negotiable laws governing Willow's autonomous agents, semantic memory, and business data ingestion. Any system violating these rules is considered unsafe.

Article I — Memory Safety

Agents must never access AuraDB directly. All memory operations go through a Graph Gateway. Arbitrary Cypher execution by agents is forbidden.

Article II — Append-Only Semantics

Agents may only append Episodes, Observations, Proposals, and CandidateFacts. Canonical memory is immutable except via Curator approval.

Article III — Business Data Immutability

Customer, Policy, Contract, and Product data ingested from OLTP systems is immutable. Corrections occur only via versioned superseding records.

Article IV — Least Privilege

Each agent receives the minimum permissions required. Credentials are short-lived and scoped.

Article V — Audit & Lineage

Every fact must be traceable to its source system, event, and ingest timestamp.
